

Wood turtle

Vulnerable in Quebec – Threatened in Canada

CHARACTERISTICS

- Brownish-gray carapace.
- Yellow belly with black spots.
- Orange neck and legs.
- Only begins to reproduce at age 15.

April to June or
September to November

Early June
to late October

Hibernation November to April

HABITAT

- 200m wide strip of land on both sides of a river, for 3km either side of the turtle's location.
- In spring, the turtle lives by the water in grasses and alder thickets.
- In the summer, it is mostly found on the terrestrial areas: in grasses, alder thickets, open woods and cutting areas.

DISTRIBUTION IN QUEBEC

Source : CDPNQ

THREATS

- Degradation and destruction of its habitat.
- Accidental mortality (roads, agricultural or forestry machinery).
- Destruction of nests by predators.
- Illegal capture.

MANAGE
YOUR
WOODLOT AND
MAINTAIN
BIODIVERSITY

IN THE 200 M BUFFER ZONE

Maintain a forested riparian buffer strip. Consult municipal by-laws for permitted widths and harvesting rates.

Ensure complete protection of alder groves.

No use of machinery between May 1 and September 30. The buffer zone is reduced to 50 m between October 1 and November 15.

Avoid the establishment of coniferous plantations. Promote a return to mixed natural regeneration.

Avoid building new roads, especially in alder groves.

Reduce speed and increase vigilance on roads and paths between May 1 and September 30 to avoid collisions with turtles.
